# Chapter 2. Preparation: Getting Images Ready Creating photos that offer up the best possible viewing experience for your readers means that you have to think about and prepare your images carefully. This chapter takes a detailed look at the process of getting your images ready for printing, editing, and storing on your hard drive. # The Importance of Good Image Preparation Begin with good preparation of your images. This means that you should focus on: \* \*\*Getting your images off your camera\*\*.

Use RAW image-processing software to do this. If your camera can't export RAW files (see Figure 2-1. The best RAW format is the DNG file, which is supported by most image-editing software packages. It's the only one that does full three-dimensional correction of your color. To see the exact format, open your RAW file and go to File→Info.")) as a JPEG or TIFF file, you should. In addition, your camera manufacturer's software probably has a "cleaning" or "regenerating" option that can fix some JPEG-related problems such as too-brighter highlights and shadows. You can also choose to do this cleaning yourself. Note that if you're shooting in a mode that's supposed to be an average-quality JPEG, your camera doesn't have to "clean" it for you. If you don't use it, the camera saves the original file, which can then be

Whether you're just learning Photoshop or are a seasoned pro, here's a beginners' guide to editing your images in Photoshop. After you complete this tutorial, you'll have more control over your images and be able to create digital photo books, posters, calendars, social media graphics and more. Step 1: Getting Started Open Photoshop and, using the Command (CTRL) key on your keyboard, select the Edit > Presets > User Defined Presets menu. Select Custom Presets and, on the right-hand side of the settings screen, tap the More button. On the next screen, tap the New Preset button. You can choose from over 100 preset styles or create your own. In this tutorial, we're going to use a preset called Eclectic Profusion Photo, which is available on the right-hand side of the New Preset options. Step 2: Preparing the Background Open the Eclectic Profusion Photo preset and change the image size to 600 px × 800 px (or whatever size you want to create). You can drag the image up and down the screen to move it up and down in the document, or click on each section to resize that area of the image. You can resize the image to any size you like, but keep it the same number of pixels in height and width to ensure the preset works correctly. Step 3: Applying the preset The preset contains two layers: a background layer and a separate background transparency layer. The Eclectic Profusion Photo style has been optimized for the background layer. You'll need to edit the other image (or layer) to remove the

main image and add a new background image. Under the layers palette, click on the red arrow next to the Background layer. This will reveal the background layer settings. Under the Background transparency tab, you'll see an option to modify this layer to add a new background image. Note: For more information on applying a preset, see *Learning Photoshop® CS4 : Presets, Styles, and Tutorials* On the left side of the settings panel is an option to "Assign an image to the Background layer." Click on this setting and choose a new image. You can choose to save your edited file (File > Save) or create a new file. Click on the full-width selection icon (the white square 05a79cecff

WO 2002/083640 A2 describes a method for determining the position of an object, in particular the position of a vehicle, in a satellite navigation system using the known position of the satellite, the known position of the object and the time at which the object is observed by the satellite. The object position is determined by detecting the distance between the object and the satellite at different points in time. The position of the object is obtained when the distance between the object and the satellite changes with a change of time. Based on the detected distance and the known time of observation of the object, the object position is determined. EP 1 124 822 B1 describes an optical system for determining the position of an object in a satellite navigation system. In this optical system, an object location for an object is determined by the position of a satellite and the distance between the satellite and the object. A first lens is arranged at a first focal length from the optical axis and a second lens is arranged at a second focal length from the optical axis. The first and the second lens have a focal length that is different from the focal length of the satellite. The object location is determined by an image of the satellite that is formed by the first lens, through which the entire satellite can be observed. U.S. Pat. No. 5,889,493 describes a method for tracking objects with radar. In this method, the distance between the radar and a target is determined. The received radar pulse is detected. The interval between the time of transmission and the time of reception of the radar pulse is also determined. From the distance and the distance between the time of transmission and the time of reception the location and the speed of the target are calculated. Evaluation of the efficacy and safety of two oral acyclovir-based fixed-dose combinations in the treatment of recurrent genital herpes: a randomized, prospective, investigator-blinded, multicenter study. Acyclovir is effective in the treatment of recurrent genital herpes. Using once-daily acyclovir in a fixed-dose combination with famciclovir may increase compliance and thus increase the efficacy of this treatment. In this prospective, randomized, multicenter, investigator-blinded, active comparator controlled study, 96 patients with recurrent genital herpes were randomized to either 500 mg acyclovir (ACV) plus 250 mg famciclovir, twice daily (ACV/FAM), or 800 mg ACV plus 400 mg fam

Cross-appointment is the practice of placing a physician in charge of more than one medical specialty. A variety of different reasons can lead to this practice. For example, two general internists may jointly be in charge of an internal medicine department. Alternatively, a neurosurgeon could be in charge of a trauma center. Along with providing exceptional patient care, many physicians consider cross-appointment to be a key component of their professional career. One option is to become a physician who specializes in pediatrics and then to complete an obstetrics/gynecology residency in order to gain skills in treating newborn infants and pregnant patients. Cross-appointment is also a component of a practice that provides comprehensive medical care, such as a group practice or a medical foundation. Groups of physicians that focus on a single area of medicine tend to focus on educating other physicians or patients within their field, rather than becoming specialists in their own right. Regardless of the reasons for cross-appointment, important skills are needed to successfully fulfill this role. Physicians must be able to treat all phases of patient care, from preventive services to the most sophisticated surgical and medical therapies. In fact, cross-appointment is more closely linked to other areas of medicine rather than being a stand-alone career. As a result of the practice, physicians gain experience in numerous arenas of medicine, and are able to better understand the complexities and individuality of each medical field. This understanding allows them to assess which area of medicine is best suited to them. For example, an orthopedic surgeon has seen a variety of conditions, from routine injuries to complex reconstructive surgery on athletes. This knowledge, combined with years of training, can make this doctor an excellent candidate for surgical work. Physicians who seek this role typically have expertise in both internal medicine and surgery. A doctor who focuses on cross-appointment can enhance his or her professional lifestyle, and may have a significant impact on a patient's life. For example, a surgeon can act as the anesthesiologist for a patient during a delicate operation. Additionally, a general internist can know the resources available at each medical center, and ensure that patients have the best treatment. Despite the benefits, cross-appointment is not always an easy option. Many physicians who seek this role do so because they feel that their heart is not in medicine, or they do not want to become specialists. Additionally, they may need extensive time off for family care, and may not want to sacrifice that time.
