No it would seem. I think the reason for the lack of progress in external integration with Photoshop is that they have been concentrating more on in-house integration with their apps, such as with Creative Cloud and Content Cloud. Other projects, such as CreativeSync, still need to be finished. These projects are half a decade in the making, so it's understandable that they are a priority. More than in-house integration with Photoshop, the new update includes a new Object Selection Tool. After you snap the Object Selection Tool to a document, you can align it on any object to make it the center of that

selection. Add text, images or even other selections and then transform the selection with a combination of drag and click to create more complex effects. So if you're editing, don't pull the object from its environment. Wield the Drag & Drop function if you want to avoid editing. As you can probably deduce, I prefer the latter but the latter is more complicated. Outside of drawing applications, Adobe has also added more of its own Do-It-Yourself (DIY) tools to make creating web graphics easier and more effective. Instead of having to download each tool separately, using the new Within Web Suite application allows you to do most tasks in one place. You can create and edit HTML forms, add social media sharing buttons, and much, much more. All you need is your iPad. This is clearly a nice update for any web designer and Photoshop users who prefer to stay offline on their mobile devices.

With CS5, it is easier than ever to work on a single or multiple files simultaneously at the same time. It includes a robust history of your previous file settings. You can make a complete retouching work within a single file and carry it through to the final place on your photo. This gives you the scope to perform and preview an entire retouching project from start to end. Adobe's Photoshop CS5 has the first implementation of Frame-Based and Layer-Based workflows. They are like two different type of workflows: Frame-Based workflow has the frames where retouching and edits can be done as you move from one frame to another. It is important to know that although the frames are different and can be moved separately, they can be seperated too. Layer-Based workflow introduces a concept that all the effect and retouching areas are placed in same image. Photoshop automatically computes the necessary frames based on the tools you've chosen. This process is similar to the traditional frame-based workflow.

You can add people to a Share for Review folder by requesting access on their behalf. After you've invited them to the project, you can invite them to join by navigating to the New menu and selecting **Share for Review**. After creating a file in several new ways, such as using a new feature called "Source Details," removing layers, moving elements, and more, our workflow can become a bit complicated. And Adobe is now introducing a feature it has been testing internally for several years

called "History." With History, you can identify and remove a duplicate layer perfectly on the fly instead of having to create a duplicate file and move or delete it. You simply choose a layer, then hit CMD+Z to "Save," and the duplicate is instantly removed. With the new features for images in the Adobe Creative Cloud application for 2021, the editing experience will become even more intuitive than ever with features such as Adobe Photoshop Lens Profile, which creates a custom light and color profile for an individual camera. On top of its ability to edit photographs and images from RAW to JPEG, and JPEG to JPEG, it further has a wide variety of special effects and filters to enhance images, and was also the first multi-paged illustration software from Adobe which improved on what other software introduced in previous decade. Whilst the technology was made to edit images, it also sparked a revolution in canvas/painting software by introducing gradient filters, dodging/burning tools, and rounded corners. If the software was left to the users' curiosity, there would be endless amount of tutorials on performance tuning, engineering, high end video production, and much more, and so forth. Undoubtedly, Photoshop has become the most widely-used graphic editor software on the planet for one big reason: it's incredibly powerful, and user-friendly, especially to beginners. I started teaching Photoshop 5 years ago but it wasn't until the students had been using it for 3 years and I was no longer able to speak to them on a daily basis. They needed a mentor, someone to pass on what they have learnt and someone who can provide feedback on their work. So, my 5 years mentoring afternoons are now being replaced by online sessions with every student individually. Some people are comfortable with technical details and

internet concepts, while others prefer to have one to one help with concepts and subject matter. So, the sessions can cover anything technical, marketing, how to or social media. I am a firm believer that if students like the idea of online tutorials they will enjoy it.
